A porcine model of intermediate pulmonary hypertension (PH) was developed in 11 chronically instrumented pigs. The mean pulmonary arterial pressure (mPAP) during control was 18.5±/4.0 mmHg and was maintained throughout the study at 16.0±/2.6 mmHg (in five pigs) or at 17.8±/3.7 mmHg (in six pigs) by fluid-filled catheters in the ascending aorta and left atrium respectively. Continuous infusion of UK-14,304, a novel direct endothelin receptor antagonist, decreased mean pulmonary arterial pressure to 8.0±/2.5 mmHg (pThe effects of cadmium on the tolerance of lettuce to salinity stress.
